

**EFFICIENCY OF ACTIVATED CARBON PRODUCED FROM
PET (POLYETHYLENE TEREPHTHALATE) WASTE
MATERIALS FOR THE TREATMENT OF MUNICIPAL SOLID
WASTE LANDFILL LEACHATE (KODUWAMADU)**

ABSTRACT

Municipal Solid Waste (MSW) is a major growing problem in urban areas of Sri Lanka. Municipal solid waste mainly composed of plastics namely polyethylene terephthalate (PET) waste. In other hand percolation of landfill leachate into the groundwater tables and aquifer system, which poses a potential risk and hazardous towards the public health and ecosystem. Therefore, there is a need for an efficient management of PET waste and also need to treat leachate before discharging into surrounding environment. Even though, there are several methods available to treat the leachate, suitable place and cost of treatments are contentious. The objectives of this study were (i) to produce the activated carbon from PET (Polyethylene terephthalate) waste materials (ii) to determine the adsorption capacity of the activated carbon using Langmuir and Freundlich models and (iii) to determine the efficiency of activated carbon for the treatment of landfill leachate (Koduwamadu). Activated carbon was prepared by carbonization followed by chemical activation with KOH. Adsorption capacity of activated carbon was determined using Langmuir and Freundlich models. The R^2 obtained by Langmuir and Freundlich models were 0.988 and 0.974, respectively. The obtained results shown that the Langmuir isotherm model was fitted well than Freundlich model. The efficiency of activated carbon for the treatment of leachate was evaluated considering the parameters of Total Dissolved Solids (TDS), Chemical Oxygen Demand (COD), Biochemical Oxygen Demand (BOD_5), phosphate, pH and Electrical Conductivity (EC). Leachate was collected from the Koduwamadu MSW landfill and initial value of above mentioned parameters were measured immediately after collection. The treated samples were collected at 3rd, 5th, 7th and 9th day to measure the above mentioned parameters. In 9th day, the maximum removal of TDS (71.44%), COD (84.66%), BOD_5 (69.16%), phosphate (55.16%) was

observed and changes in pH and EC was 7.28 ± 0.2 and 6.49 ± 0.11 mS/cm, respectively. This study revealed that activated carbon produced from PET waste materials was an efficient medium for the treatment of leachate. Even though there was a significant reduction of all parameters, TDS and pH was less than CEA permissible level of treated wastewater which could be discharged into inland water bodies. Therefore, it has been concluded that activated carbon for the treatment of landfill leachate shown better performance especially for the removal of TDS and reduction of pH compared to other parameters which were investigated.

TABLE OF CONTENTS

	Page No.
ABSTRACT	i
ACKNOWLEDGEMENT	iii
TABLE OF CONTENTS.....	v
LIST OF TABLES	ix
LIST OF FIGURES	x
ABBREVIATIONS	xi
CHAPTER 1 INTRODUCTION	1
1.1 Background information and significant	1
1.2 Justification.....	4
1.3 Objectives of the study	5
CHAPTER 2 LITERATURE REVIEW	6
2.1 Waste and waste management	6
2.2 Waste management in world.....	7
2.3 Waste management in Sri Lanka	8
2.4 MSW management techniques in Sri Lanka.....	10
2.5 Waste disposal	12
2.6 Landfill.....	12
2.7 Landfill leachate	15
2.7.1 Characteristics of landfill leachate	16

2.7.2 Current leachate treatment techniques	19
2.7.2.1 Biological treatment.....	21
2.7.2.1.1 Sequencing batch reactor	22
2.7.2.1.2 Moving bed biofilm reactor (MBBR).....	22
2.7.2.1.3 Constructed wetland	23
2.7.2.1.4 Aerated lagoon.....	23
2.7.2.2 Chemical treatment	24
2.7.2.2.1 Combined precipitation/flocculation/sedimentation.....	24
2.7.2.2.2 Chemical oxidation/ Reduction	24
2.7.2.3 Physical treatment	25
2.7.2.3.1 Filtration.....	25
2.7.2.3.2 Ion exchange	25
2.7.2.3.3 Membrane filtration process	26
2.7.2.3.4 Evaporation.....	27
2.7.2.3.5 Stripping.....	27
2.7.2.3.6 Adsorption	28
2.8 Activated carbon	28
2.8.1 Structure of activated carbon.....	29
2.8.2 Adsorption mechanism.....	32
2.8.3 PET derived activated carbon.....	33
2.9 Characterization of raw activated carbon	35
2.9.1 Proximate analysis.....	35

2.9.2 Field emission scanning electron microscope	35
2.9.3 Iodine number.....	36
2.9.4 BET surface area	36
2.9.5 Methylene blue number.....	37
2.9.6 Adsorption isotherm studies of methylene blue	38
2.9.6.1 Langmuir isotherm model.....	39
2.9.6.2 Freundlich isotherm	40
CHAPTER 3 MATERIALS AND METHODS.....	41
3.1 Experimental site	41
3.2 Experimental design and treatment.....	41
3.3 Raw material collection	41
3.3.1 Production of activated carbon from PET bottles by chemical activation	41
3.3.1.1 Adsorption study of the activated carbon.....	42
3.3.2 Landfill leachate collection and analysis.....	42
3.3.3 Treatment of landfill leachate by activated carbon	42
3.4 Effluent analysis	43
3.4.1 Total dissolved solids (TDS).....	43
3.4.2 Chemical oxygen demand (COD)	43
3.4.3 Biochemical oxygen demand (BOD ₅).....	44
3.4.4 pH	45
3.4.5 Electrical conductivity (EC).....	45
3.4.6 Phosphate.....	45

3.5 Data analysis	46
CHAPTER 4 RESULTS AND DISCUSSION	47
4.1 Adsorption isotherms study	47
4.1.1 Langmuir adsorption isotherm	47
4.1.2 Freundlich isotherm.....	48
4.2 Leachate quality.....	50
4.2.1 Characteristics of landfill leachate	50
4.2.2 TDS	51
4.2.3 COD.....	53
4.2.4 BOD ₅	54
4.2.5 Phosphate.....	56
4.2.6 pH.....	57
